WPP-2 SOLUTIONS

**Resources and
development**

Geography

WPP (Weekly Practice Paper) - 2

Made by Digraj Singh Rajput

CLASS X
SOCIAL SCIENCE - GEOGRAPHY
CHAPTER - RESOURCES AND DEVELOPMENT

Time Allowed: 1 Hours

Maximum Marks: 30

General Instructions:

- I. This question paper is divided into four sections-Section A, B, C and D.
- II. All questions are compulsory.
- III. **Section-A:** Question no. 1 to 5 are objective type questions of 1 mark each.
- IV. **Section-B:** Question no. 6 to 8 are defined type questions, carrying 2 marks each. Answers to each question should not exceed 40 words.
- V. **Section-C:** Question no. 9 to 11 are Short answer type questions, carrying 3 marks each. The answer to each question should not exceed 80 words.
- VI. **Section-D:** Question no. 12 and 13 are Long answer type questions, carrying 5 marks each. Answers to each question should not exceed 120 words.

All the best!!

SECTION-A
Objective Type Questions

1 X 5 = 5

1. Assertion/Reason -

Assertion (A): Mineral processing industries like grinding of limestone for cement industry are responsible for land degradation.

Reason (R): Mining sites are abandoned after excavation work is complete, it is the right practice to save money.

Codes:

- A. Both A and R are true, and R is the correct explanation of A.
- B. Both A and R are true, but R is not the correct explanation of A.
- C. A is true, but R is false.
- D. A is false, but R is true.

2. Match the following terms from column A with their explanation from column B:

Column A

Column B

- | | |
|----------------|---|
| a. Bangar | 1. New alluvial |
| b. Khadar | 2. Old alluvial |
| c. Regur | 3. Arable land left without cultivation for a year or more. |
| d. Fallow land | 4. Cotton soil |

- A. a - II, b - IV, c - III, d - I
- B. a - IV, b - II, c - I, d - III
- C. a - III, b - II, c - I, d - IV
- D. a - II, b - I, c - IV, d - III

3.Assertion/Reason -

Assertion (A): Resources can contribute to development only when they are accompanied by appropriate technology and institutional changes.

Reason (R): Foreign invaders exploited these resources through better technologies and earned wealth through this drain.

Codes:

- A. Both A and R are true, and R is the correct explanation of A.
- B. Both A and R are true, but R is not the correct explanation of A.
- C. A is true, but R is false.
- D. A is false, but R is true.

4) Which of the following is incorrectly matched ?

- (a) Alluvial Soil - Consist of sand and silt
- (b) Red and Yellow Soil - Develops on crystalline igneous rocks
- (c) Arid Soil - Lacks humus and moisture, sandy in texture
- (d) Laterite Soil - Made up of Lava flows

5) How does dust from mineral processing industries contribute to land degradation?

- A. It increases soil fertility
- B. It enhances water infiltration
- C. It causes waterlogging
- D. It retards water infiltration into the soil

SECTION-B

Define Type Questions

2 X 3 = 6

Write a short note on:

- 6. Alluvial Soil
- 7. Agenda 21
- 8. Net sown area

SECTION-C
Short Type Questions

3 X 3 = 9

9. Explain the methods used for preventing soil erosion. Which method can prevent soil erosion in non – slope areas or plains?
10. Distinguish between Red and Yellow soil, Laterite soil and Arid soil.
11. “Land is a natural resource of utmost importance.” Justify the Statement with appropriate arguments.

SECTION-D
Long Type Questions

5 X 2 = 10

12. What is Land degradation? What are the factors responsible for it? Suggest any four steps to control land degradation.
13. Why do we need resource planning, explain with an example? Describe the 3 stages of resource planning in India?

SECTION-A Objective Type Questions

1. Assertion/Reason -

- Assertion (A): Mineral processing industries like grinding of limestone for cement industry are responsible for land degradation.
- Reason (R): Mining sites are abandoned after excavation work is complete, it is the right practice to save money.

Codes:

- A. Both A and R are true, and R is the correct explanation of A.
- B. Both A and R are true, but R is not the correct explanation of A.
- C. A is true, but R is false.
- D. A is false, but R is true.

Ans. C. A is true, but R is false.

SECTION-A Objective Type Questions

2. Match the following terms from column A with their explanation from column B:

Column A	Column B
a. Bangar	I. New alluvial
b. Khadar	II. Old alluvial
c. Regur	III. Arable land left without cultivation for a year or more.
d. Fallow land	IV. Cotton soil

A. a - II, b - IV, c - III, d - I

B. a - IV, b - II, c - I, d - III

C. a - III, b - II, c - I, d - IV

D. a - II, b - I, c - IV, d - III

Ans. D. a - II, b - I, c - IV, d - III

SECTION-A Objective Type Questions

3. Assertion/Reason -

Assertion (A): Resources can contribute to development only when they are accompanied by appropriate technology and institutional changes.

Reason (R): Foreign invaders exploited these resources through better technologies and earned wealth through this drain.

Codes:

- A. Both A and R are true, and R is the correct explanation of A.
- B. Both A and R are true, but R is not the correct explanation of A.
- C. A is true, but R is false.
- D. A is false, but R is true.

Ans. B. Both A and R are true, and R is not the correct explanation of A.

SECTION-A Objective Type Questions

4. Which of the following is incorrectly matched ?

- | | |
|-------------------------|--|
| (a) Alluvial Soil | - Consist of sand and silt |
| (b) Red and Yellow Soil | - Develops on crystalline igneous rocks |
| (c) Arid Soil | - Lacks humus and moisture, sandy in texture |
| (d) Laterite Soil | - Made up of Lava flows |

Ans. (d) Laterite Soil - Made up of Lava flows

SECTION-A Objective Type Questions

5. How does dust from mineral processing industries contribute to land degradation?

- A. It increases soil fertility
- B. It enhances water infiltration
- C. It causes waterlogging
- D. It retards water infiltration into the soil

Ans. D. It retards water infiltration into the soil

SECTION-B Define Type Questions

6. Alluvial Soil

Ans. Alluvial Soil is a soil deposited by himalayan mountain rivers the Indus, Ganga and Brahmaputra. Found across the Ganga - Brahmaputra plain and also extended in Rajasthan, Gujarat and deltas of Mahanadi, Godavari, Krishna and Kavery.

Alluvial Soil contains very fine particles and is very fertile soil so the agriculture was done on a large scale. This soil is classified into two types: an old alluvial known as Bangar and a new alluvial known as Khadar.

SECTION-B Define Type Questions

7. Agenda 21

Ans. In 1992 in Rio de Janeiro Brazil a Summit was held addressing the problems of environmental protection and Sustainable Development of economic resources. During this summit Agenda 21 Was adopted for achieving Sustainable Development in the 21st century.

It aims at achieving global sustainable development and to combat environmental damage, poverty, disease through global co-operation and every local government should draw its own local Agenda 21.

SECTION-B Define Type Questions

8. Net sown area

Ans. Net Sown Area (NSA) is the total area of land that is cultivated and sown with crops at least once during an agricultural year.

It shows the extent of cultivated land and reflects agricultural productivity. A higher NSA indicates efficient land use, while a lower NSA suggests unused or fallow land

SECTION-C Short Type Questions

9. Explain the methods used for preventing soil erosion by wind. Which method can prevent soil erosion in non – slope areas or plains?

Ans. When wind blows it loses the top soil and also takes away the soil cover is known as wind erosion.

It may be prevented through

- i) planting grasses, shrubs and trees
- ii) Shelterbelts along the field.

Following are the measures to prevent soil erosion in non-slope areas or plain areas.

- i) Dividing the large field into strips and between the crops, strips of grass are left to grow, this would break up the force of the wind and prevent the soil from erosion.
- ii) Planting trees in a line to create shelter belts, these shelterbelts stabilise the sand dunes and prevent the soil from erosion through wind.

SECTION-C Short Type Questions

10. Distinguish between Red and Yellow soil, Laterite soil and Arid soil.

Ans. Red Soil

- i) Red soil develops on crystalline igneous rocks in areas of low rainfall.
- ii) Red and Yellow soil found in parts of Odisha, Chhattisgarh, southern parts of the middle Ganga plain and along the piedmont zone of the Western Ghats.
- iii) Wheat, cotton, oilseeds, millets, tobacco, and pulses are the main crops cultivated in red and yellow soil.

Ans. Laterite Soil

- i) The laterite soil develops under tropical and subtropical climate with alternate wet and dry seasons and results of intense leaching due to heavy rain.
- ii) Laterite soil occurs mostly in southern states, Western Ghats region of Maharashtra, Odisha, some parts of West Bengal and North-east regions.
- iii) This soil is very useful for growing tea, coffee and cashew nuts.

Ans. Arid Soil

- i) Arid soil formed from the fragmentation of rocks and is generally sandy in texture and saline in nature. Due to evaporation, salt content is very high.
- ii) Arid soil is mainly found in parts of Western Rajasthan, Haryana, and Punjab and extends up to the Rann of Kutch in Gujarat.
- iii) These soils are very infertile, but with proper fertilisers and irrigation, the drought resistant and salt tolerant dry crops such as barley, cotton, wheat, millets, maize, pulses, etc., can be grown.

SECTION-C Short Type Questions

11. “ Land is a natural resource of utmost importance.” Justify the Statement with appropriate arguments.

Ans. i) Land is not only a basic requirement for human survival and economic activities but also plays a crucial role in maintaining ecological balance. It supports natural vegetation, wild life, human life, economic activities, transport and communication systems.

ii) Plains, Mountains and Plateaus are the three important relief features which are the source of the major natural resources of utmost importance. In which plains land provides the physical space for all human activities, including habitation, agriculture, and industry.

iii) Where mountains through snow and glaciers ensure perennial flow of rivers and provide facilities for tourism, irrigation, drinking and ecological aspects. Plateaus possesses rich reserves of minerals, fossil fuels and forests and supports various economic activities such as construction, mining, and tourism.

SECTION-D Long Type Questions

12. What is Land degradation? What are the factors responsible for it? Suggest any four steps to control land degradation.

Ans. Land degradation refers to the decrease in the quality and productivity of the land and leads to the loss of biodiversity, reduced agricultural productivity, and can enhance issues like desertification and soil erosion.

Following are the factors responsible for Land degradation

Human activities such as deforestation, overgrazing, mining and improper agricultural practices are the major reasons for the Land degradation and some natural processes also lead to land degradation such as climate change and erosion.

SECTION-D Long Type Questions

Measures to control land degradation.

- i) Afforestation or planting of trees .**
- ii) In arid regions planting shelterbelts of plants and control on overgrazing.**
- iii) Proper discharge and disposal of industrial and agricultural waste.**
- iv) proper management of waste lands and control of mining activities.**
- v) Use of proper agricultural practices such as controlling over irrigation and proper use of chemical fertilisers.**

SECTION-D Long Type Questions

13. Why do we need resource planning, explain with an example? Describe the 3 stages of resource planning in India?

Ans. Resource planning is the strategy for the judicious use of resources because there is a diversity in the availability of resources, some regions are rich in certain types of resources and some regions are deficient in resources. So to make a balance and ensure the availability of resources in the country we need proper resource planning in the country.

Example -In India, Rajasthan is rich in solar and wind energy resource but deficient in water resource on the other hand Arunachal pradesh has abundance of water resource but lacks in solar and wind energy due to lacks in infrastructural development.

SECTION-D Long Type Questions

The 3 stages of resource planning in India are

- i) Identification and Inventory of resources across the regions of the country. like surveying, mapping and measurement of the resources of the region where the resources are available.
- ii)) Developing resource development plans and Making a proper planning structure with the use of appropriate technology, skill and institutional set up for implementing the plan.
- iii) Matching the resource development plans with overall national development plans.
